

Project Statement

How often have you walked into a room to do or get something, and then completely forgot the reason why you walked into that room in the first place?

This forgetfulness may also arise when a user accesses their mobile to perform a task but is distracted by the abundance of features

I propose to develop an application that will resolve this issue and enhance the user's experience

Similar Products:

Google Search widget

Launcher Apps (Nova, Evie, Hola) that allow the user to customize their operating system

System utility Apps

Apple's Handoff feature

Quick-Link

The Quick-Link App will have two main functions:

Search: the search function page will operate whenever the device is activated, this page will be linked to all the apps on the device and the web browser. There will also be link to your last search in the notifications bar.

Parsing data: Quick-Link will be able to parse specific web browser data from another one of the users devices straight to their mobile, so the user can continue with the same web page on the go.
